

1. Data Model proposal is sufficient or not:

Looking at the data model, there is a Banned User table there, but it is not linked with the user table and the Banned user table is not needed as per normalization.

In the planning and data model proposed, there is no information related to movies and submitting movies.

2. User authentication and authorization:

Three user roles are there in the workflow explained but we could not see the specific roles when registering or when login.

3. Workflow according to requirement:

Admin Dashboard:

- User Statistics displays the count for total users, no of admins, registered users per day, month, year. If we Ban the user, the count of total banned users is changing accordingly but Ban User can still access the site.

4. Look, feel, and navigation:

Adding or submit a form for the movie, the alignment of textbox and label are clustered.

It would be better to have navigation and search functionality among the available Articles.

NOTE:

Only the parts that need to improve are mentioned above as PS6 required only constructive criticism. Anyhow, we felt that there is more positive feedback or comment compared to what feedback we have mentioned.
